

3D lipomed

A Powerful Three Dimensional Alternative to Liposuction

A COMPLETE APPROACH TO TARGETED FAT REDUCTION AND BODY CONTOURING

3D-lipomed is probably one of the most advanced treatments of its type in the fight against targeted **fat reduction, cellulite** and **skin tightening**.

Its three dimensional approach to the problem ensures that you will experience one of the most effective services of its kind available today!

Why 3D-lipomed?

Many less sophisticated lipo devices on the market use diode laser as the medium to remove fat. Although this has been proven to stimulate the fat cell to release fat it is dependant on significant immediate exercise on behalf of the client to metabolise the released fat in order to achieve results.

3D-lipomed utilizes the latest generation technology called ultrasound cavitation and duo cryolipolysis (fat freezing) which are widely recognised as two of the most effective circumference techniques available. In addition to this, 3D-lipomed incorporates 3D-dermology RF for skin tightening and cellulite reduction.

Further more there is no need to exercise post treatment in order to obtain results.

1. FAT REMOVAL

What is Ultrasound Cavitation?

Cavitation is body sculpting with no anaesthesia, no scars, no discomfort, no downtime and presents a risk free alternative to liposuction.

Cavitation is a natural phenomenon based on low frequency ultrasound. The ultrasound produces a strong wave of pressure to fat cell membranes. A fat cell membrane cannot withstand this pressure and therefore disintegrates into a liquid state. The result is natural fat loss.

What is Cryolipolysis? (Fat Freezing)

Cryolipolysis selectively targets the water content of the fat cell. A temperature of -6 degrees is applied to the area of concern and maintained for a pre determined time period to damage the fat cells. The damaged fat cells begin a natural removal process that continues for up to 3 months. 3D-lipomed enables us to target two areas simultaneously.

Which Fat Removal Treatment is for me?

The individual clients goals and size determines which technology described above would be used. No other treatment combines these two advanced functions and in most cases both Cryolipolysis and Cavitation will be used in combination over a course of treatments in order to maximize the results achieved.

2. SKIN TIGHTENING

Radio Frequency Skin Tightening

For many clients, fat reduction is only part of their concern. There is also the desire to improve the appearance of cellulite and tighten the skin in specific areas of the body.

3D-lipomed's three dimensional approach to the problem ensures that not only will you experience fat reduction from Cavitation, but with the addition of 3D-dermology RF we are also able to add targeted skin tightening and cellulite reduction.

3. CELLULITE

How Does 3D-dermology RF Work?

As our skin matures and is continuously subjected to environmental effects, its connective tissue begins to break down, causing wrinkles and other signs of aging to develop. 3D-dermology uses automated vacuum skin rolling to enhance the 3D-lipo treatment by encouraging lymphatic drainage and improving the appearance of cellulite.

In addition to this, combined with 3D-dermology, Focus Fractional RF energy penetrates the skin layers to selectively heat the skin tissue and the extra cellular matrix where the collagen fibres are embedded. The local heating causes an immediate contraction of collagen fibres, and at the same time increases the metabolism of the fibroblasts thereby accelerating the production of new collagen and elastin fibres

The concentration of collagen fibres and the regeneration of the collagen and elastin deposits, tighten the skin layers creating a smoother, healthier and younger looking skin.
